

Lightning Strike

Risk Mitigation

When To Use

When there is a need to resolve risk early and then add value later

Approach

Refine the backlog to position the first sprint to provide a very basic implementation that resolves the risk immediately. It might not be pretty but satisfies the need early. Now with each successive sprint you can add value and make it pretty.

Beware...

Avoid getting trapped into a solution that is too big and too high fidelity - go grungy and only put in the most basic solution first
